The application has been amended as follows:

Claim 6. (Currently Amended) An endoscope comprising:

an elongated flexible inserting portion; and

an operating portion which is mounted on the proximal end side of the inserting portion and which has a grip portion capable of being gripped by an operator, the endoscope further comprising:

an electric device outputting predetermined signals;

an internal structure mounted in the operating portion, which is inserted in the grip portion from the proximal end side thereof to the distal end side;

a notch portion mounted to the internal structure; [[and]]

electric device mounting means which is mounted to the internal structure and mounts the electric device within the notch portion,

a plate frame provided in the internal structure of the operating portion for suppressing a deforming of the operating portion, the plate frame having the notch portion to mount the electronic device.

Claim 7. (Currently Amended) An endoscope comprising:

an elongated flexible inserting portion;

a grip portion which is mounted on the proximal end side of the inserting portion and which can be gripped by an operator;

an objective optical system which is mounted to the distal end side of the inserting portion and which can transmit an optical image of a subject into the inserting portion;

image guiding fibers which can transmit the optical image incident from the distal end side via the objective optical system to the proximal end side and which is inserted to the inserting portion so that the proximal end side extends in the grip portion from the inserting portion;

an optical image output portion which constitutes the proximal end side of the image guiding fibers and which outputs the optical image transmitted from the distal end side;

an image pick-up unit which is provided in the grip portion and is optically connected to the optical image output portion and which has an image pick-up device capable of picking up the optical image transmitted from the optical image output portion,

a plate frame provided in the grip portion for suppressing a deforming of the grip portion, the plate frame having a notch portion to mount the image pick-up unit;

wherein the optical axis of the optical image outputted to the image pick-up unit from the optical image output portion is deviated from the central axis of a portion at which the image guiding fibers are extended in the grip portion.
